# POSITIVE EXTENSIONS <br> AND INTEGRAL REPRESENTATIONS VIA SPACES OF FRACTIONS 

## F.-H. Vasilescu

University of Lille I, France

## 1. Introduction

Let $\mathbf{Z}_{+}^{n}$ be the set of all multiindices $\alpha=\left(\alpha_{1}, \ldots, \alpha_{n}\right)$, let $\mathcal{P}_{n}$ be the algebra of all polynomial functions in $t=\left(t_{1}, \ldots, t_{n}\right) \in \mathbf{R}^{n}$ with complex coefficients and let $\mathcal{P}_{n, \alpha}$ be the vector space generated by the monomials $t^{\beta}=t_{1}^{\beta_{1}} \cdots t_{n}^{\beta_{n}}$, with $\beta_{j} \leq 2 \alpha_{j}, \forall j, \alpha \in \mathbf{Z}_{+}^{n}$.

## Set $\left(\mathbf{R}_{\infty}\right)^{n}=(\mathbf{R} \cup\{\infty\})^{n}$. Con-

 sider the family $\mathcal{Q}_{n}$ consisting of all rational functions of the form$$
q_{\alpha}(t)=\left(1+t_{1}^{2}\right)^{-\alpha_{1}} \cdots,\left(1+t_{n}^{2}\right)^{-\alpha_{n}}
$$

$t \in \mathbf{R}^{n}$, where $\alpha=\left(\alpha_{1}, \ldots, \alpha_{n}\right) \in$
$\mathbf{Z}_{+}^{n}$ is arbitrary. Set also $p_{\alpha}(t)=$ $q_{\alpha}(t)^{-1}, t \in \mathbf{R}^{n}, \alpha \in \mathbf{Z}_{+}^{n}$. The function $q_{\alpha}$ can be continuously extended to $\left(\mathbf{R}_{\infty}\right)^{n} \backslash \mathbf{R}^{n}$ for all $\alpha \in$ $\mathbf{Z}_{+}^{n}$. The function $p / p_{\alpha}$ can be continuously extended to $\left(\mathbf{R}_{\infty}\right)^{n} \backslash \mathbf{R}^{n}$ for every $p \in \mathcal{P}_{n, \alpha}$, and so it can be regarded as an element of $C_{\mathbf{R}}\left(\left(\mathbf{R}_{\infty}\right)^{n}\right)$. Therefore, $\mathcal{P}_{n, \alpha}$ is a subspace of $C_{\mathbf{R}}\left(\left(\mathbf{R}_{\infty}\right)^{n}\right) / q_{\alpha}=p_{\alpha} C_{\mathbf{R}}\left(\left(\mathbf{R}_{\infty}\right)^{n}\right)$ for all $\alpha \in \mathbf{Z}_{+}^{n}$, and so

$$
\mathcal{P}_{n} \subset C_{\mathbf{R}}\left(\left(\mathbf{R}_{\infty}\right)^{n}\right) / \mathcal{Q}_{n}
$$

which is an algebra of fractions.

$$
\text { Let } \gamma=\left(\gamma_{\alpha}\right)_{\alpha \in \mathbf{Z}_{+}^{n}} \text { be an } n \text {-sequence }
$$ of real numbers and let

$$
L_{\gamma}: \mathcal{P}_{n} \rightarrow \mathbf{C}
$$

be the associated linear functional given by $L_{\gamma}\left(t^{\alpha}\right)=\gamma_{\alpha}, \alpha \in \mathbf{Z}_{+}^{n}$, extended by linearity. Recall that the $n$-sequence $\gamma=\left(\gamma_{\alpha}\right)_{\alpha \in \mathbf{Z}_{+}^{n}}$ of real numbers is said to be a moment sequence if there exists a positive measure $\mu$ on $\mathbf{R}^{n}$ such that $t^{\alpha} \in$ $L^{1}(\mu)$ and $\gamma_{\alpha}=s t^{\alpha} d \mu(t), \alpha \in$ $\mathbf{Z}_{+}^{n}$. The measure $\mu$ is said to be a representing measure for $\gamma$. Let us state a characterization of the moment sequences.

Theorem 1.1. An n-sequence $\gamma=\left(\gamma_{\alpha}\right)_{\alpha \in \mathbf{Z}_{+}^{n}}\left(\gamma_{0}>0\right)$ of real numbers is a moment sequence on $\mathbf{R}^{n}$ if and only if the associated linear functional $L_{\gamma}$ has the properties $L_{\gamma}\left(p_{\alpha}\right)>0$ and $\left|L_{\gamma}(p)\right| \leq L_{\gamma}\left(p_{\alpha}\right) \sup _{t \in \mathbf{R}^{n}}\left|q_{\alpha}(t) p(t)\right|$, $p \in \mathcal{P}_{n, \alpha}, \alpha \in \mathbf{Z}_{+}^{n}$.
As we have $\mathcal{P}_{n} \subset C_{\mathbf{R}}\left(\left(\mathbf{R}_{\infty}\right)^{n}\right) / \mathcal{Q}_{n}$, the linear map $L_{\gamma}: \mathcal{P}_{n} \mapsto \mathbb{C}$ associated to an $n$-sequence $\gamma$ can be viewed as a linear map on a subspace of an algebra of fractions. In particular, the proof of Theorem 1.1 can be derived from general results in the framework of algebras of functions.

## 2. Spaces of fractions of continuous functions

Let $\Omega$ be a compact space and let $C(\Omega)$ be the algebra of all complexvalued continuous functions on $\Omega$, endowed with the sup norm $\|*\|_{\infty}$. We denote by $M(\Omega)$ the space of all complex-valued Borel measures on $\Omega$. For every function $h \in C(\Omega)$, we set $Z(h)=\{\omega \in \Omega ; h(\omega)=0\}$. If $\mu \in M(\Omega)$, we denote by $|\mu| \in$ $M(\Omega)$ the variation of $\mu$.
Let $\mathcal{Q}$ be a family of nonnegative elements of $C(\Omega)$. The set $\mathcal{Q}$ is said to be a set of denominators if (i) $1 \in \mathcal{Q}$, (ii) $q^{\prime}, q^{\prime \prime} \in \mathcal{Q}$ implies $q^{\prime} q^{\prime \prime} \in \mathcal{Q}$, and (iii) if $q h=0$ for some $q \in \mathcal{Q}$ and $h \in C(\Omega)$,
then $h=0$. Using a set of denominators $\mathcal{Q}$, we can form the algebra of fractions $C(\Omega) / \mathcal{Q}$. If $C(\Omega) / q=$ $\{f \in C(\Omega) / \mathcal{Q} ; q f \in C(\Omega)\}$, we have $C(\Omega) / \mathcal{Q}=\cup_{q \in \mathcal{Q}} C(\Omega) / q$.
Setting $\|f\|_{\infty, q}=\|q f\|_{\infty}$ for each $f \in C(\Omega) / q$, the pair $(C(\Omega) / q$, $\left.\|*\|_{\infty, q}\right)$ becomes a Banach space. Hence, $C(\Omega) / \mathcal{Q}$ is an inductive limit of Banach spaces
Set $(C(\Omega) / q)_{+}=\{f \in C(\Omega) / q$; $q f \geq 0\}$, which is a positive cone for each $q$.
Let $\mathcal{Q}_{0} \subset \mathcal{Q}$, let $\mathcal{F}=\Sigma_{q \in \mathcal{Q}_{0}} C(\Omega) / q$, and let $\psi: \mathcal{F} \rightarrow \mathbb{C}$ be linear. The map $\psi$ is continuous if the restriction $\psi \mid C(\Omega) / q$ is continuous for all $q \in \mathcal{Q}_{0}$.

Let us also remark that the linear functional $\psi: \mathcal{F} \rightarrow \mathbb{C}$ is said to be positive if $\psi \mid(C(\Omega) / q)_{+} \geq 0$ for all $q \in \mathcal{Q}_{0}$.
The next result, which is an extension of the Riesz representation theorem, describes the dual of a space of fractions, defined as above.
Theorem 2.1. Let $\mathcal{Q}_{0} \subset \mathcal{Q}$, let $\mathcal{F}=\Sigma_{q \in \mathcal{Q}_{0}} C(\Omega) / q$, and let $\psi: \mathcal{F} \rightarrow \mathbb{C}$ be linear. The functional $\psi$ is continuous if and only if there exists a uniquely determined measure $\mu_{\psi} \in M(\Omega)$ such that $\left|\mu_{\psi}\right|\left(Z_{q}\right)=0,1 / q$ is $\left|\mu_{\psi}\right|-$ integrable for all $q \in \mathcal{Q}_{0}$ and $\psi(f)=$ ${ }_{\Omega} f d \mu_{\psi}$ for all $f \in \mathcal{F}$.

The functional $\psi: \mathcal{F} \rightarrow \mathbb{C}$ is positive, if and only if it is continuous and the measure $\mu_{\psi}$ is positive.

## Corollary 2.2. Let $\mathcal{Q}_{0} \subset \mathcal{Q}$ be

 nonempty, let $\mathcal{F}=\Sigma_{q \in \mathcal{Q}_{0}} C(\Omega) / q$, and let $\psi: \mathcal{F} \rightarrow \mathbb{C}$ be linear.The functional $\phi$ is positive if and only if $\left\|\psi_{q}\right\|=\psi(1 / q), q \in$ $\mathcal{Q}_{0}$, where $\psi_{q}=\psi \mid C(\Omega) / q$.
In the family $\mathcal{Q}$ we write $q^{\prime} \mid q^{\prime \prime}$ for $q^{\prime}, q^{\prime \prime} \in \mathcal{Q}$, meaning $q^{\prime}$ divides $q^{\prime \prime}$ if there exists a $q \in \mathcal{Q}$ such that $q^{\prime \prime}=q^{\prime} q$. A subset $\mathcal{Q}_{0} \subset \mathcal{Q}$ is cofinal in $\mathcal{Q}$ if for every $q \in \mathcal{Q}$ we can find a $q_{0} \in \mathcal{Q}_{0}$ such that $q \mid q_{0}$.

The next assertion is an extension result of linear functionals to positive ones.
Theorem 2.3. Let $\mathcal{Q}_{0} \ni 1$ be a cofinal subset of $\mathcal{Q}$. Let $\mathcal{F}=$ ${ }^{\Sigma}{ }_{q \in \mathcal{Q}_{0}} \mathcal{F}_{q}$, where $\mathcal{F}_{q}$ is a vector subspace of $C(\Omega) / q$ such that $1 / q \in$ $\mathcal{F}_{q}$ and $\mathcal{F}_{q} \subset \mathcal{F}_{r}$ for all $q, r \in$ $\mathcal{Q}_{0}$, with $q \mid r$. Let also $\phi: \mathcal{F} \rightarrow \mathbb{C}$ be linear with $\phi(1)>0$, and set $\phi_{q}=\phi \mid \mathcal{F}_{q}, q \in \mathcal{Q}_{0}$.
The linear functional $\phi$ extends to a positive linear functional $\psi$ on $C(\Omega) / \mathcal{Q}$ such that $\left\|\psi_{q}\right\|=\left\|\phi_{q}\right\|$, where $\psi_{q}=\psi \mid C(\Omega) / q$, if and only if $\left\|\phi_{q}\right\|=\phi(1 / q)>0, q \in \mathcal{Q}_{0}$.
We put $Z\left(\mathcal{Q}_{0}\right)=\cup_{q \in \mathcal{Q}_{0}} Z(q)$ for each subset $\mathcal{Q}_{0} \subset \mathcal{Q}$.

Corollary 2.4. With the conditions of the previous Theorem, there exists a positive measure $\mu$ on $\Omega$ such that

$$
\phi(f)=\int_{\Omega} f d \mu, f \in \mathcal{F} .
$$

For every such measure $\mu$ and every $q \in \mathcal{Q}$, we have $\mu(Z(q))=0$. Hence, if $\mathcal{Q}$ contains a countable subset $\mathcal{Q}_{1}$ with $Z\left(\mathcal{Q}_{1}\right)=Z(\mathcal{Q})$, then $\mu(Z(\mathcal{Q}))=0$.
Exemple 2.5. Let $\mathcal{S}_{1}$ be the algebra of polynomials in $z, \bar{z}, z \in \mathbb{C}$. This algebra, used to characterize the moment sequences in the complex plane, can be identified with a subalgebra of an algebra of fractions of continuous functions.
Let $\mathcal{R}_{1}$ be the set of functions

$$
\left\{\left(1+|z|^{2}\right)^{-k} ; z \in \mathbb{C}, k \in \mathbb{Z}_{+}\right\}
$$ which can be continously extended to $\mathbb{C}_{\infty}=\mathbb{C} \cup\{\infty\}$. Identifying $\mathcal{R}_{1}$ with the set of their extensions in $C\left(\mathbb{C}_{\infty}\right)$, the family $\mathcal{R}_{1}$ becomes a set of denominators in $C\left(\mathbb{C}_{\infty}\right)$. This will allows us to identify the algebra $\mathcal{S}_{1}$ with a subalgebra of the algebra of fractions $C\left(\mathbb{C}_{\infty}\right) / \mathcal{R}_{1}$.

Let $\mathcal{S}_{1, k}, k \geq 1$ a fixed integer, be the space generated by the monomials $z^{j} \bar{z}^{l}, 0 \leq j+l<2 k$, and the monomial $|z|^{2 k}$, which may be viewed as a subspace of $C\left(\mathbb{C}_{\infty}\right) / r_{k}$, where $r_{k}(z)=\left(1+|z|^{2}\right)^{-k}$ for all $k \geq 0$.

We clearly have $\mathcal{S}_{1}={ }^{\Sigma_{k \geq 0}} \mathcal{S}_{1, k}$, and so the space $\mathcal{S}_{1}$ can be viewed as a subalgebra of the algebra $C\left(\mathbb{C}_{\infty}\right) / \mathcal{R}_{1}$. Note also that $r_{k}^{-1} \in$ $\mathcal{S}_{1, k}$ for all $k \geq 1$ and $\mathcal{S}_{1, k} \subset \mathcal{S}_{1, l}$ whenever $k \leq l$.
According to Theorem 1.4, a linear map $\phi: \mathcal{S}_{1} \mapsto \mathbb{C}$ has a positive extension $\psi: C\left(\mathbb{C}_{\infty}\right) / \mathcal{R}_{1} \mapsto$ $\mathbb{C}$ with $\left\|\phi_{k}\right\|=\left\|\psi_{k}\right\|$ if and only if $\left\|\phi_{k}\right\|=\phi\left(r_{k}^{-1}\right)$, where $\phi_{k}=$ $\phi \mid \mathcal{S}_{1, k}$ and $\psi_{k}=\psi \mid C\left(\mathbb{C}_{\infty}\right) / r_{k}$, for all $k \geq 0$. This result can be used to characterize the Hamburger moment problem in the complex plane. Specifically, given a sequence of complex numbers $\gamma=\left(\gamma_{j, l}\right)_{j \geq 0, l \geq 0}$ with $\gamma_{0,0}=1, \gamma_{k, k} \geq 0$ if $k \geq 1$ and
$\gamma_{j, l}=\bar{\gamma}_{l, j}$ for all $j \geq 0, l \geq 0$, the Hamburger moment problem means to find a probability measure on $\mathbb{C}$ such that $\gamma_{j, l}=\int z^{j} \bar{z}^{l} d \mu(z), j \geq$ $0, l \geq 0$.
Defining $L_{\gamma}: \mathcal{S}_{1} \mapsto \mathbb{C}$ by setting $L_{\gamma}\left(z^{j} \bar{z}^{l}\right)=\gamma_{j, l}$ for all $j \geq 0, l \geq 0$ (extended by linearity), if $L_{\gamma}$ has the properties of the functional $\phi$ above insuring the existence of a positive extension to $C\left(\mathbb{C}_{\infty}\right) / \mathcal{R}_{1}$, then the measure $\mu$ is provided by Corollary 1.5.
For a fixed integer $m \geq 1$, we can state and characterize the existence of solutions for a truncated moment problem (for an extensive study of such problems we refer to
the works by Curto and Fialkow). Specifically, given a finite sequence of complex numbers $\gamma=\left(\gamma_{j, l}\right)_{j, l}$ with $\gamma_{0,0}=1, \gamma_{j, j} \geq 0$ if $1 \leq$ $j \leq m$ and $\gamma_{j, l}=\bar{\gamma}_{l, j}$ for all $j \geq$ $0, l \geq 0, j \neq l, j+l<2 m$, find a probability measure on $\mathbb{C}$ such that $\gamma_{j, l}={ }^{\prime} z^{j} \bar{z}^{l} d \mu(z)$ for all indices $j, l$. As in the previous case, a necessary and sufficient condition is that the corresponding map $L_{\gamma}$ : $\mathcal{S}_{1, m} \mapsto \mathbb{C}$ have the property $\left\|L_{\gamma}\right\|=$ $L_{\gamma}\left(1 / r_{m}\right)$. Note also that the actual truncated moment problem is slightly different from the usual one.

## 3. Operator-valued moment problems

Let $\mathcal{D}$ be a complex inner product space whose completion is denoted by $\mathcal{H}$, let $S F(\mathcal{D})$ be the space of oll sesquilinear forms on $\mathcal{D}$, and let $\phi$ : $\mathcal{P}_{n} \rightarrow S F(\mathcal{D})$ be a linear map.We look for a positive measure $F$ on the Borel subsets of $\mathbb{R}^{n}$, with values in $B(\mathcal{H})$, such that $\phi(p)(x, y)=$ ${ }^{s} p d F_{x, y}$ for all $p \in \mathcal{P}_{n}$ and $x, y \in$ $\mathcal{D}$, which is an operator moment problem. When such a positive measure $F$ exists, we say that $\phi: \mathcal{P}_{n} \rightarrow$ $S F(\mathcal{D})$ is a moment form and the measure $F$ is said to be a representing measure for $\phi$. The next result is due to Albrecht and V.

Theorem 3.1. Let $\mathcal{D}$ be a complex inner product space and let $\phi: \mathcal{P}_{n} \rightarrow S F(\mathcal{D})$ be a unital, linear map. The map $\phi$ is a moment form if and only if
(i) $\phi\left(p_{\alpha}\right)(x, x)>0$ for all $x \in$ $\mathcal{D} \backslash\{0\}$ and $\alpha \in \mathbb{Z}_{+}^{n}$.
(ii) For all $\alpha \in \mathbb{Z}_{+}^{n}, m \in \mathbb{N}$ and $x_{1}, \ldots, x_{m}, y_{1}, \ldots, y_{m} \in \mathcal{D}$ with
$\sum_{j=1}^{m} \phi\left(p_{\alpha}\right)\left(x_{j}, x_{j}\right) \leq 1, \sum_{j=1}^{m} \phi\left(p_{\alpha}\right)\left(y_{j}, y_{j}\right) \leq 1$,
and for all $f=\left(f_{j, k}\right) \in M_{m}\left(\mathcal{P}_{n, \alpha}\right)$
with $\sup _{t}\left\|q_{\alpha}(t) f(t)\right\|_{m} \leq 1$, we have

$$
\left|\sum_{j, k=1}^{m} \phi\left(f_{j, k}\right)\left(x_{k}, y_{j}\right)\right| \leq 1 .
$$

## 4. Completely contractive

## extensions

In this section we present a version of result by Albrecht and V, concerning the existence of normal extensions. We discuss it here for infinitely many operators.
Nevertheless, we first present the case of a single operator.
Fix a Hilbert space $\mathcal{H}$ and a dense subspace $\mathcal{D}$ of $\mathcal{H}$, let, as before, $S F(\mathcal{D})$ be the space of all sesquilinear forms on $\mathcal{D}$.
We recall that $\mathcal{S}_{1}$, is the set of all polynomials in $z$ and $\bar{z}, z \in \mathbb{C}$.
Considering an operator $S$, we may define a unital linear map

$$
\begin{aligned}
& \phi_{S}: \mathcal{S}_{1} \rightarrow S F(\mathcal{D}) \text { by } \\
& \phi_{S}\left(z^{j} \bar{z}^{k}\right)(x, y)=\left\langle S^{j} x, S^{k} y\right\rangle
\end{aligned}
$$

$$
x, y \in \mathcal{D}, j \in \mathbb{Z}_{+}
$$

extended by linearity to the subspace $\mathcal{S}_{1}$.
Theorem 4.1. Let $S: \mathcal{D}(S) \subset$ $\mathcal{H} \mapsto \mathcal{H}$ be a densely defined linear operator such that $S \mathcal{D}(S) \subset$ $\mathcal{D}(S)$. The operator $S$ admits a normal extension if and only if for all $m \in \mathbb{Z}_{+}, n \in \mathbb{N}$ and $x_{1}, \ldots, x_{n}$, $y_{1}, \ldots, y_{n} \in \mathcal{D}(S)$ with

$$
\sum_{j=1}^{n} \sum_{k=0}^{m}\binom{m}{k}\left\langle S^{k} x_{j}, S^{k} x_{j}\right\rangle \leq 1
$$

$$
\sum_{j=1}^{n} \sum_{k=0}^{m}\binom{m}{k}\left\langle S^{k} y_{j}, S^{k} y_{j}\right\rangle \leq 1
$$ and for all $p=\left(p_{j, k}\right) \in M_{n}\left(\mathcal{S}_{1}\right)$, with $\sup _{z \in \mathbb{C}}\left\|\left(1+|z|^{2}\right)^{-m} p(z)\right\|_{n} \leq$

1, we have

$$
\left|\sum_{j, k=1}^{n}\left\langle\phi_{S}\left(p_{j, k}\right) x_{k}, y_{j}\right\rangle\right| \leq 1
$$

Theorem 4.1 is a direct consequence of a more general assertion, to be stated in the sequel. A version of the theorem above has been obtained by Stochel and Szafraniec, via a completely different approach.
Let $\mathcal{Q} \subset C(\Omega)$ be a set of positive denominators. Fix a $q \in \mathcal{Q}$. A linear map $\psi: C(\Omega) / q \rightarrow S F(\mathcal{D})$ is called unital if $\psi(1)(x, y)=\langle x, y\rangle$, $x, y \in \mathcal{D}$.
We say that $\psi$ is positive if $\psi(f)$ is positive semidefinite for all $f \in$ $(C(\Omega) / q)_{+}$.

More generally, let $\mathcal{Q}_{0} \subset \mathcal{Q}$ be nonempty. Let $\mathcal{C}=\Sigma_{q \in \mathcal{Q}_{0}} C(\Omega) / q$, and let $\psi: \mathcal{C} \rightarrow S F(\mathcal{D})$ be linear. The map $\psi$ is said to be unital (resp. positive) if $\psi \mid C(\Omega) / q$ is unital (resp. positive) for all $q \in \mathcal{Q}_{0}$.

We start with a part of a theorem by Albrecht and V.
Theorem A. Let $\mathcal{Q}_{0} \subset \mathcal{Q}$ be nonempty, let $\mathcal{C}=\Sigma_{q \in \mathcal{Q}_{0}} C(\Omega) / q$, and let $\psi: \mathcal{C} \rightarrow S F(\mathcal{D})$ be linear and unital. The map $\psi$ is positive if and only if

$$
\begin{aligned}
& \sup \left\{\left|\psi\left(h q^{-1}\right)(x, x)\right| ; h \in C(\Omega),\|h\|_{\infty} \leq 1\right\} \\
& \quad=\psi\left(q^{-1}\right)(x, x), q \in \mathcal{Q}_{0}, x \in \mathcal{D}
\end{aligned}
$$

Let again $\mathcal{Q}_{0} \subset \mathcal{Q}$ be nonempty and let $\mathcal{F}=\Sigma_{q \in \mathcal{Q}_{0}} \mathcal{F}_{q}$, where $1 / q \in$ $\mathcal{F}_{q}$ and $\mathcal{F}_{q}$ is a vector subspace of $C(\Omega) / q$ for all $q \in \mathcal{Q}_{0}$. Let $\phi$ : $\mathcal{F} \mapsto S F(\mathcal{D})$ be linear. Suppose that $\phi\left(q^{-1}\right)(x, x)>0$ for all $x \in$ $\mathcal{D} \backslash\{0\}$ and $q \in \mathcal{Q}_{0}$. Then $\phi(1 / q)$ induces an inner product on $\mathcal{D}$, and let $\mathcal{D}_{q}$ be the space $\mathcal{D}$, endowed with the norm given by $\|*\|_{q}^{2}=$ $\phi(1 / q)(*, *)$.
Let $M_{n}\left(\mathcal{F}_{q}\right)\left(\operatorname{resp} . M_{n}(\mathcal{F})\right)$ denote the space of $n \times n$-matrices with entries in $\mathcal{F}_{q}($ resp. in $\mathcal{F})$.

Note that $M_{n}(\mathcal{F})=\Sigma_{q \in \mathcal{Q}_{0}} M_{n}\left(\mathcal{F}_{q}\right)$ may be identified with a subspace of the algebra of fractions $C\left(\Omega, M_{n}\right) / \mathcal{Q}$, where $M_{n}$ is the $C^{*}$-algebra of $n \times$ $n$-matrices with entries in $\mathbb{C}$. Moreover, the map $\phi$ has a natural extension $\phi^{n}: M_{n}(\mathcal{F}) \mapsto S F\left(\mathcal{D}^{n}\right)$, given by $\phi^{n}(\mathbf{f})(\mathbf{x}, \mathbf{y})=\sum_{j, k=1}^{n} \phi\left(f_{j, k}\right)\left(x_{k}, y_{j}\right)$, for all $\mathbf{f}=\left(f_{j, k}\right) \in M_{n}(\mathcal{F})$ and $\mathbf{x}=\left(x_{1}, \ldots, x_{n}\right), \mathbf{y}=\left(y_{1}, \ldots, y_{n}\right) \in$ $\mathcal{D}^{n}$.
Let $\phi_{q}^{n}=\phi^{n} \mid M_{n}\left(\mathcal{F}_{q}\right)$. Endowing the Cartesian product $\mathcal{D}^{n}$ with the norm $\|\mathbf{x}\|_{q}^{2}=\Sigma_{j=1}^{n} \phi(1 / q)\left(x_{j}, x_{j}\right)$ if $\mathbf{x}=\left(x_{1}, \ldots, x_{n}\right) \in \mathcal{D}^{n}$, and denoting it by $\mathcal{D}_{q}^{n}$, we say that
the map $\phi^{n}$ is contractive if $\left\|\phi_{q}^{n}\right\| \leq$ 1 for all $q \in \mathcal{Q}_{0}$. Using the standard norm $\|*\|_{n}$ in the space of $M_{n}$, the space $M_{n}\left(\mathcal{F}_{q}\right)$ is endoved with the norm
$\left\|\left(q f_{j, k}\right)\right\|_{n, \infty}=\sup _{\omega \in \Omega}\left\|\left(q(\omega) f_{j, k}(\omega)\right)\right\|_{n}$,
for all $\left(f_{j, k}\right) \in M_{n}\left(\mathcal{F}_{q}\right)$.
Following Arveson and Powers, we shall say that the map $\phi: \mathcal{F} \mapsto$ $S F(\mathcal{D})$ is completely contractive if the $\operatorname{map} \phi^{n}: M_{n}(\mathcal{F}) \mapsto S F\left(\mathcal{D}^{n}\right)$ is contractive for all integers $n \geq 1$.
Note that a linear map $\phi: \mathcal{F} \mapsto$ $S F(\mathcal{D})$ with the property $\phi(1 / q)(x, x)>$ 0 for all $x \in \mathcal{D} \backslash\{0\}$ and $q \in$ $\mathcal{Q}_{0}$ is completely contractive if and
only if for all $q \in \mathcal{Q}_{0}, n \in \mathbb{N}$, $x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{n} \in \mathcal{D}$ with

$$
\sum_{j=1}^{n} \phi\left(q^{-1}\right)\left(x_{j}, x_{j}\right) \leq 1,
$$

$$
\sum_{j=1}^{n} \phi\left(q^{-1}\right)\left(y_{j}, y_{j}\right) \leq 1
$$

and for all $\left(f_{j, k}\right) \in M_{n}\left(\mathcal{F}_{q}\right)$ with $\left\|\left(q f_{j, k}\right)\right\|_{n, \infty} \leq 1$, we have

$$
\left|\sum_{j, k=1}^{n} \phi\left(f_{j, k}\right)\left(x_{k}, y_{j}\right)\right| \leq 1 .
$$

Let us recall another result by Albrecht and V., given here in a shorter form.

Theorem B. Let $\Omega$ be a compact space and let $\mathcal{Q} \subset C(\Omega)$ be a set of positive denominators. Let also $\mathcal{Q}_{0}$ be a cofinal subset of $\mathcal{Q}$, with $1 \in \mathcal{Q}_{0}$.

Let $\mathcal{F}={ }_{\Sigma_{q \in \mathcal{Q}_{0}}} \mathcal{F}_{q}$, where $\mathcal{F}_{q}$ is a vector subspace of $C(\Omega) / q$ such that $1 / r \in \mathcal{F}_{r} \subset \mathcal{F}_{q}$ for all $r \in \mathcal{Q}_{0}$ and $q \in \mathcal{Q}_{0}$, with $r \mid q$. Let also $\phi: \mathcal{F} \rightarrow S F(\mathcal{D})$ be linear and unital, and set $\phi_{q}=$ $\phi \mid \mathcal{F}_{q}, \phi_{q, x}(*)=\phi_{q}(*)(x, x)$ for all $q \in \mathcal{Q}_{0}$ and $x \in \mathcal{D}$.

The following conditions are equivalent:
(a) The map $\phi$ extends to a unital, positive, linear map $\psi$ on $C(\Omega) / \mathcal{Q}$ such that, for all $x \in \mathcal{D}$ and $q \in$ $\mathcal{Q}_{0}$, we have: $\left\|\psi_{q, x}\right\|=\left\|\phi_{q, x}\right\|$, where $\psi_{q}=\psi \mid C(\Omega) / q, \psi_{q, x}(*)=$ $\psi_{q}(*)(x, x)$.
(b) $\left(\right.$ i) $\phi\left(q^{-1}\right)(x, x)>0$ for all $x \in \mathcal{D} \backslash\{0\}$ and $q \in \mathcal{Q}_{0}$.
(ii) The map $\phi$ is completely contractive.
Remark. A "minimal" subspace of $C(\Omega) / \mathcal{Q}$ to apply Theorem C is obtained as follows. If $\mathcal{Q}_{0}$ is a cofinal subset of $\mathcal{Q}$ with $1 \in \mathcal{Q}_{0}$, we define $\mathcal{F}_{q}$ for some $q \in \mathcal{Q}_{0}$ to be the vector space generated by all fractions of the form $r / q$, where $r \in \mathcal{Q}_{0}$ and $r \mid q$.

It is clear that the subspace $\mathcal{F}=$ ${ }^{\Sigma} q \in \mathcal{Q}_{0} \mathcal{F}_{q}$ has the properties required to apply Theorem B.
Corollary C. Suppose that condition (b) in Theorem B is satisfied. Then there exists a positive $B(\mathcal{H})$-valued measure $F$ on the Borel subsets of $\Omega$ such that

$$
\phi(f)(x, y)=\zeta_{\Omega} f d F_{x, y}
$$

for all $f \in \mathcal{F}, x, y \in \mathcal{D}$. For every such measure $F$ and every $q \in \mathcal{Q}_{0}$, we have $F(Z(q))=0$.

Example 4.2. We extend to infinitely many variables the Example 2.5. Let $\mathcal{I}$ be a (nonempty) family of indices.

Denote by $z=\left(z_{\iota}\right)_{\iota \in \mathcal{I}}$ the independent variable in $\mathbb{C}^{\mathcal{I}}$. Let also $\bar{z}=\left(\bar{z}_{\iota}\right)_{\iota \in \mathcal{I}}$. Let $\mathbb{Z}_{+}^{(\mathcal{I})}$ be the set of all collections $\alpha=\left(\alpha_{\iota}\right)_{\iota \in \mathcal{I}}$ of nonnegative integers, with finite support. Setting $z^{0}=1$ for $0=(0)_{\iota \in \mathcal{I}}$ and $z^{\alpha}=\Pi_{\alpha_{\iota} \neq 0} z_{\iota}^{\alpha_{\iota}}$ for $z=\left(z_{\iota}\right)_{\iota \in \mathcal{I}} \in$ $\mathbb{C}^{\mathcal{I}}, \alpha=\left(\alpha_{\iota}\right)_{\iota \in \mathcal{I}} \in \mathbb{Z}_{+}^{(\mathcal{I})}, \alpha \neq$ 0 , we may consider the algebra of those complex-valued functions $\mathcal{S}_{\mathcal{I}}$ on $\mathbb{C}^{\mathcal{I}}$ consisting of expressions of the form $\Sigma_{\alpha, \beta \in \mathcal{J}} c_{\alpha, \beta} z^{\alpha} \bar{z}^{\beta}$, with $c_{\alpha, \beta}$ complex numbers for all $\alpha, \beta \in \mathcal{J}$, where $\mathcal{J} \subset \mathbb{Z}_{+}^{(\mathcal{I})}$ is finite.
We can embed the space $\mathcal{S}_{\mathcal{I}}$ into the algebra of fractions derived from the basic algebra $C\left(\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}}\right)$,
using a suitable set of denomina-
tors. Specifically, we consider the family $\mathcal{R}_{\mathcal{I}}$ consisting of all rational functions of the form $r_{\alpha}(t)=$ ${ }^{\Pi_{\alpha_{\iota} \neq 0}}{ }\left(1+\left|z_{\iota}\right|^{2}\right)^{-\alpha_{\iota}}, z=\left(z_{\iota}\right)_{\iota \in \mathcal{I}} \in$ $\mathbb{C}^{\mathcal{I}}$, where $\alpha=\left(\alpha_{\iota}\right) \in \mathbb{Z}_{+}^{(\mathcal{I})}, \alpha \neq$ 0 , is arbitrary. Of course, we set $r_{0}=1$. The function $r_{\alpha}$ can be continuously extended to
$\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}} \backslash \mathbb{C}^{\mathcal{I}}$ for all $\alpha \in \mathbb{Z}_{+}^{(\mathcal{I})}$. In fact, actually the function $f_{\beta, \gamma}(z)=$ $z^{\beta} \bar{z}^{\gamma} r_{\alpha}(z)$ can be continuously extended to $\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}} \backslash \mathbb{C}^{\mathcal{I}}$ whenever $\beta_{\iota}+\gamma_{\iota}<2 \alpha_{\iota}$, and $\beta_{\iota}=\gamma_{\iota}=$ 0 if $\alpha_{\iota}=0$, for all $\iota \in \mathcal{I}$ and $\alpha, \beta, \gamma \in \mathbb{Z}_{+}^{(\mathcal{I})}$. Moreover, the family $\mathcal{R}_{\mathcal{I}}$ becomes a set of denominators in $C\left(\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}}\right)$. This shows that
the space $\mathcal{S}_{\mathcal{I}}$ can be embedded into the algebra of fractions $C\left(\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}}\right) / \mathcal{R}_{\mathcal{I}}$.
To be more specific, for all $\alpha \in$ $\mathbb{Z}_{+}^{(\mathcal{I})}, \alpha \neq 0$, we denote by $\mathcal{S}_{\mathcal{I}, \alpha}^{(1)}$ the linear spaces generated by the monomials $z^{\beta} \bar{z}^{\gamma}$, with $\beta_{\iota}+\gamma_{\iota}<$ $2 \alpha_{\iota}$ whenever $\alpha_{\iota}>0$, and $\beta_{\iota}=$ $\gamma_{\iota}=0$ if $\alpha_{\iota}=0$. Put $\mathcal{S}_{\mathcal{I}, 0}^{(1)}=\mathbb{C}$.
We also define $\mathcal{S}_{\mathcal{I}, \alpha}^{(2)}$, for $\alpha \in \mathbb{Z}_{+}^{(\mathcal{I})}, \alpha \neq$ 0 , to be the linear space generated by the monomials $|z|^{2 \beta}=\Pi_{\beta_{l} \neq 0}\left(z_{l} \bar{z}_{l}\right)^{\beta_{l}}$, $0 \neq \beta, \beta_{\iota} \leq \alpha_{\iota}$ for all $\iota \in \mathcal{I}$ and $|z|=\left(\left|z_{\iota}\right|\right)_{\iota \in \mathcal{I}}$. We define $\mathcal{S}_{\mathcal{I}, 0}^{(2)}=$ $\{0\}$.
Set $\mathcal{S}_{\mathcal{I}, \alpha}=\mathcal{S}_{\mathcal{I}, \alpha}^{(1)}+\mathcal{S}_{\mathcal{I}, \alpha}^{(2)}$ for all $\alpha \in \mathbb{Z}_{+}^{(\mathcal{I})}$. Note that, if $f \in \mathcal{S}_{\mathcal{I}, \alpha}$, the function $r_{\alpha} f$ extends continu-
ously to $\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}}$ and that $\mathcal{S}_{\mathcal{I}, \alpha} \subset$ $\mathcal{S}_{\mathcal{I}, \beta}$ if $\alpha_{\iota} \leq \beta_{\iota}$ for all $\iota \in \mathcal{I}$.
It is now clear that the algebra
$\mathcal{S}_{\mathcal{I}}=\Sigma_{\alpha \in \mathbb{Z}_{+}^{(\mathcal{I})}} \mathcal{S}_{\mathcal{I}, \alpha}$ can be identified with a subalgebra of $C\left(\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}}\right) / \mathcal{R}_{\mathcal{I}}$.
This algebra has the properties of the space $\mathcal{F}$ appearing in the statement of Theorem B.
Let now $T=\left(T_{\iota}\right)_{\iota \in \mathcal{I}}$ be a family of linear operators defined on a dense subspace $\mathcal{D}$ of a Hilbert space $\mathcal{H}$ such that $T_{\iota}(\mathcal{D}) \subset \mathcal{D}$ and $T_{\iota} T_{\kappa} x=T_{\kappa} T_{\iota} x$ for all $\iota, \kappa \in \mathcal{I}$, $x \in \mathcal{D}$.
Setting $T^{\alpha}$ as in the case of complex monomials, which is possible because of the commutativity of the
family $T$ on $\mathcal{D}$, we may define a unital linear map $\phi_{T}: \mathcal{S}_{\mathcal{I}} \rightarrow S F(\mathcal{D})$ by

$$
\phi_{T}\left(z^{\alpha} \bar{z}^{\beta}\right)(x, y)=\left\langle T^{\alpha} x, T^{\beta} y\right\rangle
$$

for all $x, y \in \mathcal{D}, \alpha, \beta \in \mathbb{Z}_{+}^{(\mathcal{I})}$, which extends by linearity to the subspace $\mathcal{S}_{\mathcal{I}}$ generated by these monomials. For all $\alpha, \beta$ in $\mathbb{Z}_{+}^{(\mathcal{I})}$ with $\beta-\alpha \in$ $\mathbb{Z}_{+}^{(\mathcal{I})}$, and $x \in \mathcal{D} \backslash\{0\}$, we have $0<\langle x, x\rangle \leq \phi_{T}\left(r_{\alpha}^{-1}\right)(x, x) \leq \phi_{T}\left(r_{\beta}^{-1}\right)(x, x)$.
The polynomial $1 / r_{\alpha}$ will be denoted by $s_{\alpha}$ for all $\alpha \in \mathbb{Z}_{+}^{(\mathcal{I})}$.
The family $T=\left(T_{\iota}\right)_{\iota \in \mathcal{I}}$ is said to have a normal extension if there exist a Hilbert space $\mathcal{K} \supset \mathcal{H}$ and a family $N=\left(N_{\iota}\right)_{\iota \in \mathcal{I}}$ consisting of
commuting normal operators in $\mathcal{K}$ such that $\mathcal{D} \subset \mathcal{D}\left(N_{\iota}\right)$ and $N_{\iota} x=$ $T_{\iota} x$ for all $x \in \mathcal{D}$ and $\iota \in \mathcal{I}$.
A family $T=\left(T_{\iota}\right)_{\iota \in \mathcal{I}}$ having a normal extension is also called a subnormal family.
The following result is a version of theorem by Albrecht and V, valid for an arbitrary family of operators We mention that, the basic space has been modified.
Theorem 4.3. Let $T=\left(T_{\iota}\right)_{\iota \in \mathcal{I}}$ be a family of linear operators defined on a dense subspace $\mathcal{D}$ of a Hilbert space $\mathcal{H}$.

Assume that $\mathcal{D}$ is invariant un$\operatorname{der} T_{\iota}$ for all $\iota \in \mathcal{I}$ and that $T$ is a commuting family on $\mathcal{D}$.
The family $T$ admits a normal extension if and only if the map $\phi_{T}: \mathcal{S}_{\mathcal{I}} \mapsto S F(\mathcal{D})$ has the property that for all $\alpha \in \mathbb{Z}_{+}^{(\mathcal{I})}, m \in \mathbb{N}$ and $x_{1}, \ldots, x_{m}, y_{1}, \ldots, y_{m} \in \mathcal{D}$ with $\Sigma_{j=1}^{m} \phi_{T}\left(s_{\alpha}\right)\left(x_{j}, x_{j}\right) \leq 1$, $\Sigma_{j=1}^{m} \phi_{T}\left(s_{\alpha}\right)\left(y_{j}, y_{j}\right) \leq 1$, and for all $p=\left(p_{j, k}\right) \in M_{m}\left(\mathcal{S}_{\mathcal{I}, \alpha}\right)$ with $\sup _{z}\left\|r_{\alpha}(z) p(z)\right\|_{m} \leq 1$, we have

$$
\left|\sum_{j, k=1}^{m} \phi_{T}\left(p_{j, k}\right)\left(x_{k}, y_{j}\right)\right| \leq 1 .
$$

Remark. Let $S: \mathcal{D}(S) \subset \mathcal{H} \mapsto$ $\mathcal{H}$ be an arbitrary linear operator. If $B: \mathcal{D}(B) \subset \mathcal{K} \mapsto \mathcal{K}$ is a nor-
mal operator such that $\mathcal{H} \subset \mathcal{K}$, $\mathcal{D}(S) \subset \mathcal{D}(B), S x=P B x$ and $\|S x\|=\|B x\|$ for all $x \in \mathcal{D}(S)$, where $P$ is the projection of $\mathcal{K}$ onto $\mathcal{H}$, then we have $S x=B x$ for all $x \in \mathcal{D}(S)$. Indeed, $\langle S x, S x\rangle=$ $\langle S x, B x\rangle$ and $\langle B x, S x\rangle=\langle P B x, S x\rangle=$ $\langle S x, S x\rangle=\langle B x, B x\rangle$. Hence, we have $\|S x-B x\|=0$ for all $x \in$ $\mathcal{D}(S)$.
Remark 4.4. Let $T=\left(T_{\iota}\right)_{\iota \in \mathcal{I}}$ be a family of linear operators defined on a dense subspace $\mathcal{D}$ of a Hilbert space $\mathcal{H}$. Assume that $\mathcal{D}$ is invariant under $T_{\iota}$ and that $T$ is a commuting family on $\mathcal{D}$. If the map $\left.\phi_{T}: \mathcal{S}_{\mathcal{I}} \mapsto S F(\mathcal{D})\right)$ is as in Theorem 2.3, the family has a proper
quasi-invariant subspace. In other words, there exists a proper Hilbert subspace $\mathcal{L}$ of the Hilbert space $\mathcal{H}$ such that the subspace $\left\{x \in \mathcal{D}\left(T_{\iota}\right) \cap\right.$ $\mathcal{L} ; T x \in \mathcal{L}\}$ is dense in in $\mathcal{L}$ for each $\iota \in \mathcal{I}$.
For the proof of Theorem 4.3, we need the following version of the spectral theorem.
Theorem 4.5. Let $\left(N_{\iota}\right)_{\iota \in \mathcal{I}}$ be a commuting family of normal operators in $\mathcal{H}$. Then there exists a unique spectral measure $G$ on the Borel subsets of $\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}}$ such that each coordinate function
$\left(\mathbb{C}_{\infty}\right)^{\mathcal{I}} \ni z \rightarrow z_{\iota} \in \mathbb{C}_{\infty}$ is $G$ almost everywhere finite. In ad-
dition,

$$
\left\langle N_{\iota} x, y\right\rangle=\int_{\left(\mathbb{C}_{\infty}\right)} \mathcal{I} z_{\iota} d E_{x, y}(z)
$$

for all $x \in \mathcal{D}\left(N_{\iota}\right), y \in \mathcal{H}$, where
$\mathcal{D}\left(N_{\iota}\right)=\left\{x \in \mathcal{H} ; \int_{\left(\mathbb{C}_{\infty}\right)}\left|z_{\iota}\right|^{2} d E_{x, x}(z)<\infty\right\}$, for all $\iota \in \mathcal{I}$.
If the set $\mathcal{I}$ is at most countable, then the measure $G$ has support in $\mathbb{C}^{\mathcal{I}}$.
